

ABSTRACT

In accordance with the teachings described herein, systems and methods are provided for managing communications between a mobile device and a wireless network. The mobile device may include an executable network management program that causes the mobile device to
5 terminate a first communication link with the wireless network while in an out-of-coverage state, and queue data in the mobile device relating to the first communication link. The network management program may further cause the mobile device to receive instructions to establish a second communication link between the mobile device and the wireless network, and delete the queued data relating to the first communication link.
